

Full Stack Development: Summary

Today Covered Topic – Exception Handling

Exception Handling:

- Exception Handling is to handle runtime errors.
- An exception is an unexpected event that occurs during program execution.
- It allows the program to continue executing after handling the error.

Types of Exception Handling:

1. Checked Exception
2. Unchecked Exception

Keyword in Exception handling:

try → Risky code

catch → Handle exception

finally → Always executes

throw → Manually throw an exception

throws → Declare that a method may throw an exception

Default Exceptions:

package exceptionhandling;

public class Default {

public static void main(String[] args) {

try {

int[] arr = {10, 20, 30};

System.out.println(arr[5]);

}

catch (ArrayIndexOutOfBoundsException e) {

System.out.println("Array index is out of range.");

}

```
        System.out.println("Program finished");
    }
}
```

Custom Exception:

```
package exceptionhandling;

class SalaryException extends Exception {
    SalaryException(String msg) {
        super(msg);
    }
}

public class Custom {
    static void checkSalary(int salary) throws SalaryException {
        if (salary < 20000) {
            throw new SalaryException("Salary should be at least 20000");
        } else {
            System.out.println("Salary Successfully Proceed");
        }
    }

    public static void main(String[] args) {
        try {
            checkSalary(10000);
        }
        catch (Exception e) {
            System.out.println(e.getMessage());
        }

        System.out.println("Program Successfully Finished");
    }
}
```
