

SPRING BOOT

CHAPTER -1 Summary

TODAY COVERED TOPICS:

- ❖ **SPRING**
- ❖ **FRAMEWORK**
- ❖ **SPRING INTERNALS**
- ❖ **JAR FILE**
- ❖ **SPRING – FEATURES & CONCEPTS**

➤ **SPRING:**

Spring is used to build a enterprise or web application ,spring is easy use to build it so we need to use spring.

➤ **FRAMEWORK:**

Frame is used to provide environment or tools for application. Then workshop / environment is also called Framework.

➤ **Spring Internals:**

- In spring contains lots of classes and Interfaces. These are provided as JAR file.

➤ **JAR FILE:**

JAR – Java Archive File.

- It contains:
 - ✓ Classes
 - ✓ Interfaces
 - ✓ Configuration need to run java application

➤ **Spring – Features & Concepts:**

1. POJO-Plain Old Java Object:

- POJO class file contains:
 - Private variables.
 - Getters and Setters
- All Function written inside POJO files.
- Spring Creates & Manage POJO files using Spring Configuration.

2. Dependency Injection:

Objects are created & dependencies are injected automatically by spring.

3. REST API – REST Application Program Interface:

It is used to build a data transfer between client & server.

4. MVC – Model View Controller:

- **Model – Used for Data Structure , handles business logic.**
- **Controller – Control logic , user request & responses connects model & view.**
- **View – Display data to user.**

User – Controller – Model – view – User.

➤ Why we need POJO:

- **To hide data (encapsulation)**
- **To restrict access to users**
- **To make applications more secure**
- **Spring applications are more secure using POJO structure.**
