

FullStack Development – Day 15 Summary

Today Covered Topic:

- ❖ **Constructor**
- ❖ **Types of Constructor**
- ❖ **Constructor Overloading**

➤ **Constructor:**

Constructor is also called as Special function because when we create a object its automatically call .constructor is class name is same as constructor name.it does not use void or return type. It is used for initialize the object or value.

Syntax:

```
Class ClassName{  
    ClassName(){  
    }  
}
```

➤ **Types Of constructor:**

- Default Constructor
- Parameterized Constructor
- Copy Constructor
 - ❖ Default Constructor: a no parameter

Eg:

```
class Student {  
  
    Student() {  
        System.out.println("Welcome");  
    }  
  
}
```

- ❖ Parameterized Constructor: Customized Parameter.

Eg:

```
class Student {  
  
    String name;  
  
    Student(String n) {  
        name = n;  
    }  
  
    void display() {  
        System.out.println(name);  
    }  
}
```

```

    }

    public class Main {
        public static void main(String[] args) {

            Student s1 = new Student("Selvi");

            s1.display();
        }
    }

```

➤ **Constructor Overloading:**

It have multiple constructor in the same class but each with different numbers or types of parameters. It's also called compile – time Polymorphism.

Eg:

```

class Student {

    String name;
    int age;
    Student() {
        name = "Unknown";
        age = 0;
    }
    Student(String n) {
        name = n;
        age = 0;
    }
    Student(String n, int a) {
        name = n;
        age = a;
    }

    void display() {
        System.out.println("Name: " + name);
        System.out.println("Age: " + age);
    }
}

public class Main {
    public static void main(String[] args) {

        Student s1 = new Student();
        Student s2 = new Student("Selvi");
        Student s3 = new Student("Karthi", 21);

        s1.display();
        s2.display();
    }
}

```

```
        s3.display();  
    }  
}
```
