

Full Stack Development – Super Keyword

Today Covered Topic:

➤ Super Keyword:

Super keyword is used to access parent class constructor, methods, and variables from the child class. `super()` always calls the parent class constructor.

Eg:

```
class Stud {  
    Stud(String name) {  
        System.out.println("Enter the name: "+name);  
    }  
}
```

```
class Subject extends Stud {  
    Subject(String name, int age) {  
        super(name);  
        System.out.println("Age:"+age);  
    }  
}
```

```
public class SuperKeyword {  
    public static void main(String[] args) {  
        Subject s = new Subject("Porselvi", 20);  
    }  
}
```

Use Of Super:

- Super. Variable
Eg: `System.out.println(super.name);` - Access parent variable.
- Super .method()
Eg: `Super.Show()` – Call Parent Method.
- Super()
Eg: `super()` – call parent constructor.
