

Full Stack Development – Day 13 Summary

Today Covered Topics:

- ❖ Function
- ❖ Types of Function
- ❖ Method Keyword Types

➤ Function :

Function is used to perform a specific task in the block of code.

Syntax:

```
returnType MethodName(Parameters)
{
    Return value;
}
```

Ex:

```
Public class Para{
    Static void Name(){
        System.out.println("Porselvi");
    }
    public static void main(String[]args){
        Name();
    }
}
```

➤ Types of Function:

1. No Parameters & No Return Value

Eg:

```
public class NoParaNoReturn {
    static void Name() {
        System.out.print("Porselvi");
    }
    public static void main(String[]args) {
        Name();
    }
}
```

2. Parameter but No return value

Eg:

```
public class ParaButNoReturn {
    static void add(int a, int b) {
        System.out.println("sum:"+(a+b));
    }
    public static void main(String[]args) {
```

```

        add(10,11);
    }
}

```

3. No Parameter but Return value

Eg:

```

public class NoParaButReturn {
    static int numbers() {
        return 7;
    }
    public static void main(String[] args) {
        int num=numbers();
        System.out.println(num);
    }
}

```

4. Parameter & Return Value

Eg:

```

public class ParaAndReturn {
    static int num(int a ,int b) {
        return a*b;
    }

    public static void main(String[] args) {
        int multiply=num(4,5);
        System.out.println(multiply);
    }
}

```

➤ Method Keyword Types:

- Instance Method – Obj.display();
- Static Method – className.methodame()
- Abstract Method – abstract void show();
- Final Method - final void display()
- Native Method – native void MethodName()

➤ Based on Functionality / Purpose:

- ✓ User defined Methods – Created by Programmer.
- ✓ Pre – defined Methods – Already available in java libraries(like string , Math)
